

**Math 8851. Homework #4. To be completed by 5pm on Fri, Oct 20**

Below [DDMS] refers to the book ‘Analytic pro- $p$  groups’, 2nd edition by Dixon, du Sautoy, Mann and Segal.

Before stating Problem 1 we introduce several definitions.

**Definition.** A *supernatural number* is a formal product  $\prod_p p^{a_p}$  where  $p$  ranges over all primes and each  $a_p$  is either a non-negative integer or infinity.

Supernatural numbers form a monoid with respect to multiplication given by

$$\prod_p p^{a_p} \cdot \prod_p p^{b_p} = \prod_p p^{a_p+b_p}$$

where as usual we set  $\infty + x = x + \infty = \infty$  for any  $x \in \mathbb{Z}_{\geq 0} \sqcup \{\infty\}$ .

It is not hard to show that for any non-empty set  $S$  of supernatural numbers there are unique greatest common divisor  $gcd(S)$  (which is a multiple of any common divisor of the elements of  $S$ ) and least common multiple  $LCM(S)$  (which divides any common multiple of the elements of  $S$ ), and moreover both  $gcd(S)$  and  $LCM(S)$  are given by the standard formulas: if  $S = \{s_i\}_{i \in I}$  where  $s_i = \prod_p p^{a_{i,p}}$ , then  $gcd(S) = \prod_p p^{m_p}$  and  $LCM(S) = \prod_p p^{M_p}$  where  $m_p = \inf\{a_{i,p} : i \in I\}$  and  $M_p = \sup\{a_{i,p} : i \in I\}$ .

If  $G$  is a profinite group, the order of  $G$  is the supernatural number  $|G|$  defined by

$$|G| = LCM(\{|G/N| : N \text{ is an open normal subgroup of } G\}).$$

Note that  $G$  is pro- $p$  for some prime  $p \iff |G| = p^a$  for some  $a \in \mathbb{Z}_{\geq 0} \sqcup \{\infty\}$ .

If  $H$  is a closed subgroup of  $G$ , we define the index  $[G : H]$  by  $[G : H] = LCM(\{|G : U|\})$  where  $U$  ranges over all open subgroups of  $G$  containing  $H$ .

**Definition.** Let  $G$  be a profinite group and  $p$  a prime dividing  $|G|$ . A closed subgroup  $H$  of  $G$  is called a *Sylow pro- $p$  subgroup* if  $H$  is a pro- $p$  subgroup and  $[G : H]$  is coprime to  $p$ .

One can show that Sylow pro- $p$  subgroups always exist and any two Sylow pro- $p$  subgroups of  $G$  are conjugate (see Problems 1.11 and 1.12 in [DDMS]), but this is not part of this homework.

1.

- (a) Prove that if  $G$  is a profinite group and  $H$  is a closed normal subgroup of  $G$ , then  $|G| = |G/H| \cdot |H|$ .
- (b) Let  $G = SL_n(\mathbb{Z}_p)$  (where as usual  $\mathbb{Z}_p$  is  $p$ -adic integers). Describe explicitly a Sylow pro- $p$  subgroup of  $G$  and prove your answer. **Hint:** Problem 5 from HW#1 is relevant here.

2. We start with some definitions. Let  $A$  be an associative ring with 1 and  $M$  a right  $R$ -module. A map  $f : A \rightarrow M$  is called a *derivation* if

- (1)  $f(a + b) = f(a) + f(b)$  for all  $a, b \in A$ ;
- (2)  $f(ab) = f(a) \cdot b + f(b)$  for all  $a, b \in A$ .

The set of all derivations from  $A$  to  $M$  (which is clearly an abelian group with respect to pointwise addition) will be denoted by  $Der(A, M)$ .

If  $G$  is a group and  $M$  is a right  $G$ -module, a derivation from  $G$  to  $M$  is a map  $G \rightarrow M$  satisfying (2) above (for all  $a, b \in G$ ). Again we denote by  $Der(G, M)$  the set of all derivations from  $G$  to  $M$ , which is still an abelian group. Recall that  $Der(G, M)$  appeared in class in the course of the explicit description of the first cohomology, namely

$$H^1(G, M) \cong Der(G, M) / IDer(G, M)$$

where  $IDer(G, M)$  is the subgroup of inner derivations (maps of the form  $g \mapsto m - m \cdot g$  for some fixed  $m \in M$ ); however, this is not directly related to this problem. The main point of this problem is to give an important example of a derivation in the case of a non-trivial action (which actually arises in some proofs that I am going to discuss in class).

Now the actual problem begins

- (a) Let  $G$  be a group and  $M$  a right  $G$ -module. Prove that the restriction map  $Der(\mathbb{Z}[G], M) \rightarrow Der(G, M)$  is an isomorphism of abelian groups.
- (b) Again let  $G$  be a group and  $\omega_G$  be the augmentation ideal of  $\mathbb{Z}[G]$  (the ideal generated by all elements of the form  $g - 1$ ,  $g \in G$ ). Prove that if  $X$  generates  $G$  as a group, then the set  $\{x - 1 : x \in X\}$  generates  $\omega_G$  as a right  $G$ -module (equivalently,  $\mathbb{Z}[G]$ -module).

- (c) Now assume that  $G$  is a free group and  $X$  is a free generating set for  $G$ . Then one can show (this is not part of the problem) that  $\omega_G$  is a free right  $\mathbb{Z}[G]$ -module, freely generated by  $\{x - 1 : x \in X\}$ , that is, for any  $f \in \omega_G$  there exist unique elements  $\{D_x(f)\}_{x \in X}$  such that

$$f = \sum_{x \in X} (x - 1)D_x(f)$$

(if  $X$  is infinite, we implicitly require that only finitely many  $D_x(f)$  are nonzero). Prove that for any  $x \in X$  the map  $\frac{\partial}{\partial x} : G \rightarrow \mathbb{Z}[G]$  given by  $\frac{\partial}{\partial x}(g) = D_x(g - 1)$  is a derivation. It is called the (right) Fox derivative with respect to  $x$ .

**3.** Let  $X$  and  $Y$  be topological spaces and  $C(X, Y)$  the space of continuous maps from  $X$  to  $Y$ . The *compact-open* topology on  $C(X, Y)$  is the topology with subbase  $\{U_{K,O}\}$  where  $K \subseteq X$  is compact,  $O \subseteq Y$  is open and  $U_{K,O} = \{f \in C(X, Y) : f(K) \subseteq O\}$ .

Now let  $W/F$  be a Galois extension and consider  $\text{Gal}(W/F)$  as a subset of  $C(W, W)$  where  $W$  is endowed with the discrete topology. Prove that the Krull topology on  $\text{Gal}(W/F)$  coincides with the compact-open topology (that is, the topology induced from the compact-open topology on  $C(W, W)$ ).

**4.** Let  $W/F$  be a Galois extension and  $L$  a subfield of  $W/F$ .

- (a) Prove that the Krull topology on  $\text{Gal}(W/L)$  is induced from the Krull topology on  $\text{Gal}(W/F)$ .
- (b) Assume now that  $L/F$  is Galois, so that  $\text{Gal}(W/L)$  is normal in  $\text{Gal}(W/F)$  and  $\text{Gal}(W/F)/\text{Gal}(W/L)$  is canonically isomorphic to  $\text{Gal}(L/F)$ . Prove that under this isomorphism, the Krull topology on  $\text{Gal}(L/F)$  corresponds to the quotient topology on  $\text{Gal}(W/F)/\text{Gal}(W/L)$ .

**5.** Let  $\{d_n\}_{n \in \mathbb{N}}$  be a sequence of pairwise coprime integers and  $K = \mathbb{Q}(\sqrt{d_1}, \sqrt{d_2}, \dots)$ . Define the map  $\iota : \text{Gal}(K/\mathbb{Q}) \rightarrow \mathbb{F}_2^\infty$  by  $\iota(\varphi) = (a_1, a_2, \dots)$  where  $a_i = 0$  if  $\varphi(\sqrt{d_i}) = \sqrt{d_i}$  and  $a_i = 1$  if  $\varphi(\sqrt{d_i}) = -\sqrt{d_i}$ . Prove that  $\iota$  is a group isomorphism.

**6.** In each part of this problem we are given a Galois extension  $W/F$  and a closed subgroup  $H$  of  $G = \text{Gal}(W/F)$ . Find (with proof) the fixed  $L$  of  $H$  (equivalently, find the unique field  $L$  such that  $\text{Gal}(W/L) = H$ ). In each part we also fix a prime  $p$ .

- (a)  $F$  is a finite field,  $W = \overline{F}$  and  $H = \prod_{q \neq p} \mathbb{Z}_q$ . (Recall that in this case  $G$  is canonically isomorphic to  $\widehat{\mathbb{Z}} = \prod_q \mathbb{Z}_q$ .)
- (b)  $F = \mathbb{Q}$ ,  $W = \mathbb{Q}(\{\zeta_n : n \in \mathbb{N}\})$  where  $\zeta_n$  is a primitive  $n^{\text{th}}$  root of unity and  $H = \prod_{q \neq p} \mathbb{Z}_q^\times$ . (Recall that in this case  $G$  is canonically isomorphic to  $\widehat{\mathbb{Z}}^\times = \prod_q \mathbb{Z}_q^\times$ .)
- (c) Let  $F$  and  $W$  be as in (b), and let  $H$  be the product of  $\prod_{q \neq p} \mathbb{Z}_q^\times$  (the subgroup from (b)) and the subgroup  $(\mathbb{Z}_p^\times)^2$  consisting of all squares in  $\mathbb{Z}_p^\times$ . (As stated in class, if  $p$  is odd, then  $\mathbb{Z}_p^\times \cong \mathbb{Z}/(p-1)\mathbb{Z} \times \mathbb{Z}_p$ , so  $(\mathbb{Z}_p^\times)^2$  has index 2 in  $\mathbb{Z}_p^\times$  and  $\mathbb{Z}_2^\times \cong \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}_2$ , so  $(\mathbb{Z}_2^\times)^2$  has index 4 in  $\mathbb{Z}_2^\times$ .)

**Hint:** Analyzing the proofs of the isomorphisms  $\text{Gal}(W/F) \cong \widehat{\mathbb{Z}}$  in (a) and  $\text{Gal}(W/F) \cong \widehat{\mathbb{Z}}^\times$  in (b) and (c) will probably be helpful for all parts. In (c) you may need to use some facts not discussed in Algebra-II to rigorously prove the answer.
